Abstract

In sand casting foundry, quality of sand mould is very important to get a high-quality casting. The present work is focussed on partial replacement of foundry sand by Ant hill clay (slit) and also to get good sand mould properties which in turn will give defect free castings. The, responses such as green compression strength (GCS), green shear strength (GSS), mould hardness number and permeability were studied. The factors considered for experimentation were Ant hill to Sand ratio (Ant hill quantity in terms of Percentage weight of sand), number of strokes, water quantity and coal dust. Experiments were carried out using central composite design of response surface methodology which is a part of Design of Experiments. Two replicates were done and also randomization and blocking is implemented during experimentation. The optimization is carried out to maximise GCS, Green Shear Stregth. The multi-objective optimization is done to get a same settings for both GCS and GSS. Thus obtained settings of factors were not there in experimental desig matrix, hence the confirmation tests wereconducted. The five confirmation test were carried out and the average Green Compression strength was 1502gms/cm², the optimum level of GSS average value of Green Shear Stregth was 356gm/cm2 because of the conflection requirements of both GCS and GSS, multi objectives optimization is done by using discribable function approach and level for this average values 1373 gms/cm² and 335gms/cm². From optimized levels, 15% of sand can be replaced with ant hill clay without the need of bentonite.

Keywords: Sand Casting, Cental Composite Design, Ant Hill Slit, Green Compression Strength, Design of Experiments, Optimization.

BUCKLING ANALYSIS OF AXIALLY LOADED NANOBEAMS RESTING ON A ROTATIONAL ELASTIC FOUNDATION

Svetlana Lilkova-Markova^{1*}, Dimitar Lolov²

¹University of Architecture, Civil Engineering and Geodesy, Faculty of Hydraulic Engineering, Departmant of Technical Mechanics, Sofia, Bulgaria

² University of Architecture, Civil Engineering and Geodesy, Faculty of Hydraulic Engineering, Departmant of Technical mechanics, Sofia, Bulgaria

Abstract

A nanobeam with a static scheme of a simply supported beam was investigated. It rests along its entire length on a rotary elastic foundation. The cross section of the nanobeam is circular. The nanobeam is loaded axially with a compressive force. The nonlocal theory of elasticity is applied. A parametric study was performed to obtain the buckling force for different values of the radius of the cross section and the rigidity of the rotational foundation.

Keywords: Nanobeam, Nonlocal Theory, Buckling Force, Rotational Elastic Foundation.

TENSILE CHARACTERIZATION OF GLASS FIBER REINFORCED COMPOSITE MATERIALS WITH STRAIN GAUGE AND VIRTUAL EXTENSOMETER

Muhsin Alçı^{1*}, Recep Güneş²

¹ Niğde Ömer Halisdemir Üniversitesi Makine Mühendisliği Bölümü, Niğde, Türkiye

² Erciyes Üniversitesi Makine Mühendisliği Bölümü, Kayseri, Türkiye

Abstract

Fiber-reinforced composite (FRC) materials have become the indispensable basic materials of many industries due to their low weight and high strength today. As a result, intensive studies are carried out on the characterization of these materials and the development of material models. FRC materials are subjected to many characterization tests for different material models developed due to their anisotropic structures. The most basic of these are tensile tests. In order to determine the deformation in tensile tests, strain gauges specially produced for FRC materials are generally used. The use of strain gauges can be quite laborious and expensive in characterization studies. Although strain gauges are essential for some application areas, the measurement of strain with the Digital Image Correlation (DIC) method is becoming widespread for tests that can be imaged with the help of a camera today. In the DIC method, measurements can be made on uneven surfaces by taking images with more than one camera at the same time (stereo cameras) by calibrating the cameras. However, since a flat surface can be obtained on the composite in the tensile test, accurate results can be obtained by positioning a single camera directly opposite the measurement surface. In this study; Tensile tests of glass fiber reinforced composites produced by vacuum assisted resin infusion method was carried out according to ASTM D3039 tensile test standard, both with the help of strain gauges and with the help of virtual extensometer using DIC method with a single camera. The results show that a virtual extensometer can be used instead of a strain gauge in tensile tests of fiber-reinforced composites.

EFFECT OF CURING METHODS ON THE MECHANICAL STRENGTH AND DURABILITY OF PREFABRICATED CONCRETES INTENDED FOR ALGER MARITIME QUAY

Ben Ammar Ben Khadda¹

¹Mohamed Khider University, Civil and Hydraulic Engineering Department, Biskra, Algeria

Abstract

Sustainability nowadays occupies a decisive position in the new European normative context on concrete and which requires an effective control of all the factors likely to affect its behavior over time. The influence of atmospheric curing methods by solar energy on the mechanical strength for prefabricated concrete elements Intended for maritime quay was investigated. An experimental program was carried out to study in parallel the effect of water/cement ratio (0.4, 0.5 and 0.6), the influence of cement type and the influence of curing methods (four methods of curing were used: water curing, air curing, steam curing at 29°C and steam curing at 45°C) on the compressive strength of samples concrete. Six similar formulations of workability are made from ordinary Portland cement (CEM I 42.5) and a compound cement (CEM II/B 42.5), three of each type are studied. The results obtained demonstrate the beneficial effect of a steam curing procedure to achieve high compression, especially in the early curing ages, and that these concrete at all ages are durable and protected from any degradation.

Keywords : Concrete, Curing Methods, Solar Energy, Mechanical Strength, Durability.

NEUTRON BEAM ANALYSIS OF AGING AND CREEP PROCESSES IN MATERIALS AND PARTS FROM DECOMMISSIONING OF NUCLEAR FACILITIES

Massimo ROGANTE 1*

¹ Studio D'ingegneria Rogante, Contrada San Michele, n. 61 62012 Civitanova Marche (MC) Italy

Abstract

Lifetime extension and safety conditions of a Nuclear Facility (NF) are key issues and a deep knowledge of the ageing and creep processes related to the involved materials is fundamental to guarantee high levels of reliability and to deal with severe natural and plant–centred occurrences. The investigations conventionally used in this case, including non-destructive techniques (NDT) and in-service inspections required by the codes, can present a lack of information. The data obtained, therefore, need to be complemented.

NFs decommissioning is an important opportunity to get materials and parts submitted for various years to ageing and degradation, allowing new diagnostic activities helpful to suggest eventual additional measures for the installation of new components or in planning a postponed decommissioning, in order to enhance dependability and safety.

Neutron beam techniques (NBT) have lately become a progressively more helpful support in the non-destructive and non-invasive characterisation of industrial materials and parts of nuclear/traditional interests, and there are positive recommendations to use neutron methods for reactor materials' control. Applications of neutron-based methods, furthermore, have been developed in a variety of new sectors.

In this paper, ageing processes occurring in the NFs field are briefly introduced as well as a short description of some examples of applications. The obtainable results, associated with knowledge of nature and features of materials' damages, assist to understand the trends of materials fracture and evaluate a latent picture of preliminary degradation processes leading to any fast crash of material, including eventual period of inoperability prior to the NF decommissioning.

Keywords : Neutron Beam, Nuclear Facilities.

TETRAPODS BASED SMART MATERIALS FOR ADVANCED TECHNOLOGIES

Reza Abolhassani¹, Fateme Mirsafi¹, Horst-Günter Rubahn¹, Yogendra Kumar Mishra¹

¹Smart Materials, NanoSYD, Mads Clausen Institute,

¹University of Southern Denmark, Alsion 2, 6400, Sønderborg, DENMARK

Abstract

Considering the size dependent utilization complexities of nanoscopic dimensions towards real applications, the focus of nanomaterials community is merging to three-dimensional (3D) form of materials which are built out interconnected nanostructures. This talk will briefly introduce the importance of complex shaped nanostructures towards smart 3D nanomaterials structuring. A simple flame based single step approach was developed for synthesizing zinc oxide tetrapods which demonstrated many applications in different technologies. These tetrapods have been used as building blocks to construct highly porous interconnected 3D nanometworks in form of flexible ceramics which offer further new application avenues. Additionally, these 3D networks have been utilized as sacrificial templates to develop hollow tetrapodal 3D networks from almost any desired material, carbons, nitrides, oxides, polymers, hydrogels, etc. The sacrificial template-based strategy offers new and unique opportunities in the direction of 3D nanomaterials engineering and accordingly advanced technological applications. Some examples of 3D nanomaterials engineering will be demonstrated alongwith their applications [1-10]. The scopes of 3D nanostructuring based smart materials in sensing, electronics, optoelectronics, energy, and biomedical engineering will be briefly highlighted in the talk.

GROWTH OF IRON DIBORIDE LAYER ON SAE 1020 STEEL BY FOUR APPROACHES

Mourad Keddam^{1*}

¹ University of Science and Technology Houari Boumediene, Laboratoire de Technologie des Matériaux, Bab-Ezzouar, Algiers, Algeria

Abstract

The pack-boriding kinetics of SAE 1020 steel has been studied through utilizing four mathematical approaches in case of the formation of iron diboride layers. For each model, the values of boron diffusivity in Fe₂B in the range of 850 to 950°C with incubation times included. Finally, the models were put to the test by comparing the predicted results to the simulated values of Fe₂B layer thickness determined at 925°C for 6 hours.

Keywords : Boriding, Iron Diboride, Kinetics, Activation Energy, Diffusion Models.

HYDROPHOBIC COATING WITH SOL-GEL TECHNIQUE ON TITANIUM METAL SUBSRATE

Najran Mohammed Nasser Hosrom^{1*}, Atilla Evcin²

¹ 22 may street apt:1 No:5 Amran, Yemen

² Afyon Kocatepe University, Materials Science and Engineering Department, Afyonkarahisar, Turkey

Abstract

The wettability of solid surfaces is an important topic in material science and fundamental research. Because of their numerous potential applications, intensive research have been done in recent years. The sol-gel process is an extensively used method to prepare the various coating and films because it has a many advantage according to other film formation methods, such as low temperature processing, easy coating of large surfaces, good adhesion ability to surface of film or coating, homogeneous oxide film formation, and adjustment of film composition and porosity. In this study, it was tried to create a hydrophobic coating on Ti (titanium) metal substrate with Sol-gel technique. In the preparation of the coating solution, tetraethoxy silane - TEOS (C8 H20 O4 Si), Ethanol (C2 H6 0), Purified water, Nitric Acid (HNO3) were used. Coating solution was applied on metal surface by dip coating method. Scanning electron microscope (SEM LEO 1430 VP model) was used to examine the microstructure of the obtained products. Attention ThetaLite 101 contact angle measuring device was used to determine the wetting properties of the prepared nanocomposite surfaces.

HAVA ARAÇLARINDA KULLANILAN HİBRİT TAKVİYELİ EPOKSİ KOMPOZİTLERİN ÜRETİMİ VE MEKANİK ÖZELLİKLERİ

Mürsel Ekrem^{1*}

¹ Necmettin Erbakan Üniversite, Makine Mühendisliği Bölüm, Konya, Türkiye

Özet

Bu çalışmada, ağırlıkça % 0.25 Çok Cidarlı Karbon Nanotüp (ÇCKNT) ile ağırlıkça farklı oranlarda (% 0.25, 0.5 ve 0.75) nanoSiO₂ parçacıklı epoksi esaslı nanokompozitlerin üretimi ve mekanik özellikleri incelenmiştir. ASTM D638-10 standardına göre üretimi yapılan epoksi esaslı hibrid nanokompozitlerin çekme numuneleri sabit çekme hızında çekme testine tabi tutulmuştur. Modifiye edilmiş epoksi hibrid nanokompozitlerin maksimum yükleri, çekme dayanımları, elastiklik modülleri, toklukları ve birim şekil değiştirme değerleri hesaplanmış olup, bu testin sonucunda bu özellikler epoksi numuneyle kıyaslanmıştır. Referans numune ile ağırlıkça % 0.25 oranındaki ÇCKNT ve ağırlıkça % 0.5 oranındaki nanoSiO₂ parçacık takviyeli nanokompozitin maksimum yükleri sırasıyla 1730 N ve 1875 N olup, 0.25CNT+0.5 nanoSiO₂ epoksi esaslı kompozit % 8 oranında artış gözlemlenmiştir.

Anahtar Kelimeler: Çekme Dayanımı, Epoksi Nanokompozitler, MWCNT, Nano SiO₂.

DOĞAL VE SENTETİK FİBER TAKVİYELİ POLİMER KOMPOZİTLERİN KURU KAYMA KOŞULLARINDA AŞINMA ORANI VE SÜRTÜNME KATSAYISI ARASINDAKİ İLİŞKİNİN BELİRLENMESİ

Lemiye Atabek Savaş¹*

¹ Erciyes Üniversitesi, Malzeme Bilimi ve Mühendisliği Bölümü, Kayseri, Türkiye

Özet

Bu calısmada yüksek-yoğunluklu polietilen (HDPE) matrisli karbon, bazalt ve kokonat fiber takviyeli (%10 ve %30) kompozitlerin kayma asınma davranışları incelenmiş olup, aşınma oranları ile sürtünme katsayıları arasındaki ilişki araştırılmıştır. Kompozitler ergiyik harmanlama yöntemi ile üretilmiş, uyumlaştırıcı olarak maleik anhidrit-aşılı polietilen (PE-g-MA) kullanılmıştır. Ek olarak kokonat fiberlerin matris malzemesi ile karışabilirliğini bir adım daha artırmak için sodyum hidroksit (NaOH) çözeltisi içinde alkali yüzey işlemi uygulanmıştır. Aşınma testleri özel üretim bir ball-on-disk tribometresi kullanılarak kuru kayma şartlarında, 5 N normal yük ve 1100 dev/dak kayma hızında açık atmosfer koşullarında tamamlanmıştır. Yapılan tribo-testler sonucunda, kullanılan tüm bileşimlerdeki kompozitlerin sürtünme katsayılarının saf HDPE'den yüksek olduğu tespit edilmistir. En düsük sürtünme katsayısına 0,121 ile saf HDPE'de ulasılmıstır. %30 bazalt fiber iceren HD-BF30 numunesi 0,303 ile en yüksek sürtünme katsayısı değerini vermiştir. Aşınma oranı her bir fiber için konsantrasyon ile artış eğilimindedir. Karbon fiber takviyeli kompozitler saf polimerden yüksek sürtünme katsayısına sahip olsa da yüksek rijitliğinden dolayı daha yüksek aşınma direnci sergilemişlerdir. En düşük aşınma oranına 64×10-6 (mm3 N-1m-1) ile %10 karbon fiber içeren kompozitte ulaşılmıştır. Kokonat fiber takviyeli kompozitler karbondan sonra ikinci en yüksek aşınma direncine sahip kompozitler olup, aynı konsantrasyonda bazalt fiberden daha yüksek aşınma direnci göstermişlerdir. En yüksek aşınma oranı 177×10-6 (mm3 N-1m-1) ile %30 bazalt fiber içeren kompozitte görülmüştür. Sonuç olarak karşılaştırılan fiberler içerisinde karbon fiberin düsük sürtünme ve yüksek asınma direnci anlamında diğer fiberlere göre üstün olduğu bulunmustur. Fiber tipine göre sürtünme katsayısı ve aşınma oranı değerleri değişkenlik gösterebilmektedir.

Anahtar Kelimeler : Yüksek-Yoğunluklu Polietilen, Karbon Fiber, Bazalt Fiber, Kokonat Fiber, Aşınma Oranı, Sürtünme Katsayısı.

SELF-CLEANING OF HYDROPHOBIC SURFACES

Abdullah Alawadhi^{1*}, Atilla Evcin²

¹ Sana'a, Yemen

² Afyon Kocatepe University, Materials Science and Engineering Department, Afyonkarahisar, Turkey

Abstract

In Greek, "hydro" means "water", "phobos" means "fear" and "philia" means "friendship". Afraid of hydrophobic water, that does not like water; hydrophilic means friends with water, that is, loves water. These surfaces are named according to the angle of contact they make with the water. Superhydrophobic means water-hating, superhydrophilic means water-loving. If the water droplet spreads completely on the surfaces, it is superhydrophilic; If the droplet is spherical on the surface and its angle with the surface is greater than 150° and approaching 180°, they are called superhydrophobic surfaces. The "Water Repellent" coating on the surface is called hydrophobic coating. Thus, it creates problems in using and cleaning the materials as clear. In this study, ceramic tile was coated with a silicone compound. An organic–inorganic molecular hybrid compound was firstly prepared by the mixing of silicone rubber-salts-silane coupling agent. Prepared mixture was coated on a clean ceramic tile by a film applicator. After samples were characterized by scanning electron microscope (SEM) and Contact Angle Goniometer. Superhydrophobic surface was obtained Zn stearate doped modified silanes.

Keywords : Silicone, Superhydrophobic, Contact angle.

COATING OF TIO2 DOPED HYDROXYAPATITE ON TI6AL4V ALLOY WITH HVOF TECHNIQUE

Nada Alloush^{1*}, Atilla Evcin²

¹ Idlib, Suriye

² Afyon Kocatepe University, Materials Science and Engineering Department, Afyonkarahisar, Turkey

Abstract

Hydroxyapatite is a calcium salt found in bone and teeth with the chemical formula Ca10(PO4)6(OH)2. It forms the inorganic part of the bone structure. Calcium phosphate based HA is used as a bioceramic material due to its biocompatibility, as artificial bone, in the manufacture of various prostheses, in the repair of broken and cracked bones, and in the coating of metallic biomaterials. Traditionally, the use of titanium has been concentrated in the aircraft, space and marine industries. The metal's durability and rigid structure, low specific gravity and relative lightness, resistance to high temperatures and resistance to corrosion have led to its widespread use in these special areas. In recent years, there has been a significant increase in the medical and dental applications of titanium and titanium alloys. In this study, Hydroxyapatite containing 1, 2 and 3% TiO2 powder was coated on the Ti alloy by the High Velocity Oxy Fuel (HVOF) method. The coatings were characterized in terms of their contact-opening and morphological properties.

MANUFACTURING OF COCOON PLANTER USING INDEGENIOUS RECYCLABLE MATERIAL

Enjila Irfan¹, Areeba Alam¹, Hafsa Shafi¹, Afifa Baqai¹

¹Materials Engineering Department, NED Universitty of Engineering an Technology

Abstract

"Cocoon planter" is a water-efficient technology that helps trees to survive with little irrigation even in desert-like climates. It provides a safe shelter from the harsh surrounding environment and an adequate water for irrigation of first critical year of tree. Cocoon Planter is basically an Innovative technologies of planting and foresting to people living in arid and semi-arid climates. In our Cocoon Planter we aren't using the standard materials that are being used until now by Land Life and Groasis Companies. Instead we are using an indigenous material that are available in Pakistan to make the Cocoon Planter.

SYSTEMATIC REDUCTION OF CASTING DEFECTS WITH THE HELP OF MODELING AND SIMULATION

Muhammmad Abdul Hai¹, Shaheer Siddiqui¹, Kamran Khalid¹, Hammad Siddiqui¹

¹NED University Of Engineering and Technology, Materials Engineering Department

Abstract

Sand casting, also known as sand molded casting, is a metal casting process characterized by using sand as the mold material. Over 60% of all metal castings are produced via sand casting process. Modeling refers to creation of a 3d model using a CAD software. It is then exported to a CAE software for Simulation or to a CAM software for manufactur-ing. Simulation is the imitation of a situation or process on a CAE Soft-ware. It is used for the purpose of thermal analysis, removing defects, optimization etc. It includes designing a 3d model on a CAD software, exporting it to a CAE software for simulation, filling in the parameters, and observing the results.

DESIGN AND DEVELOPMENT OF SUPERCRITICAL DRYING SYSTEM (SCD) FOR SILICA AEROGEL PRODUCTION

¹M.Saad Khan, ¹Usama Khan, ¹Ahazam Ansari, ¹Tayyab Azad Khan

¹Ned University of Engineering and Technology Karachi Department of Materials Engineering

Abstract

Aerogels belongs to an innovative class of advanced materials with applications ranging from heat transfer to fluid separation processes. This research study focuses on the development of a Super critical drying (SCD) systems which is an integral part to produce fine quality aerogels. A typical SCD system consists of a high pressure chamber (up to 100bar) with temperature range of 50°C. After research and the group has completed the procurement of the SCD parts, and assembly of the system[2]. This SCD system was designed and developed and the synthesis of Silica aerogel was performed by using different organic chemicals i.e TMOS, Methanol, Ammonium Hydroxide. The study aims at synthesis of silica-based aerogels using phase one SCD system and got the final product which is Silica Aerogel. [2] The silica aerogel is characterized by using Scanning Electron Microscopy, X-ray Diffraction and Fourier Transfrom Infrared Spectroscopy to conclude the final product which is Silica Aerogel.

SIMULATION OF BORIDING KINETICS OF AISI T 1 STEEL BY INTEGRAL MODEL

Brahim Boumaalı^{1*}

¹ University of Science and Technology Houari Boumediene, Laboratoire de Technologie des Matériaux, Bab-Ezzouar, Algiers, Algeria

Abstract

AISI T1 steel was hardened by the solid boriding process in the temperature range 1123-1273K, for a period of 2 to 8 hours. A kinetic model, based on the integral method, was applied to the growth of a single boride (Fe2B) layer on the surface of AISI T1 steel. The activation energy for the diffusion of boron in AISI T1 steel was estimated at 213.03 kJ mol-1 and a comparison was made with other values available in the literature. A satisfactory concordance has been observed when comparing the experimental values of Fe2B layers' thicknesses with the predicted results. This diffusion model has been validated experimentally by considering two additional boriding conditions.

DESIGN AND DEVELOPMENT OF GREEN COMPOSITES USING NATURAL FIBERS

Hafiz Muhammed Bilal Hussain¹, Muhamed Sami Khan¹, Ebad Hassan Khan¹

¹ Ned University of Engineering & Technology Department of Materials Engineering

Abstract

Green composites are basically sustainable composites materials that are combination of Natural Fibers and Natural resins. Importance of these materials is biodegradability, use of natural material and strength, due to these characteristics they have gained a lot of importance in the field of Materials engineering. The overview of the project is as follows; To Develop a fiber reinforced green composite having gelatin matrix reinforced with natural fibers (include coconut, banana and sugar cane). To Compare the mechanical properties of different fibers reinforcement in a similar matrix. To Compare the effect of fiber length (different Grades of Fibers) on mechanical properties of a similar material in same matrix. Fibers were collected from the warehouse and then shredded and boiled in hot water in order to remove contamination. Banana & Sugarcane fibers are rich in sugar so their boiling is mandatory to remove the juicy liquid from them. After boiling in hot water for half an hour they were filtered and then dried in air for five days. After complete drying they were subjected to grinding to obtain a workable size of them to proceed further for composite making. According to the given composition matrix was prepared and then fibers are embedded in mold and samples are prepared through hand layup process.

Keywords : Green Composites, Natural Fibers, Natural Resins, Biodegradability

DESIGN OF EXPERIMENTS (DOE) FOR THE DEVELOPMENT OF GREEN TYRE TREAD BY REDUCING CARBON WITH ECO-FRIENDLY FILLER

Hamna Siddiqui¹, Syed Usama Athar¹, Arsal Sohal¹, Asad Raza¹

¹ Ned University of Engineering and Technology Materials Engineering Department

Abstract

Design of experiments(DOE) is defined as a branch of applied statistics that deals with planning, conducting, analyzing, and interpreting controlled tests to evaluate the factors that control the value of a parameter or group of parameters. DOE is a powerful data collection and analysis tool that can be used in a variety of experimental situations. DOE is suitable for a condition where more than one in put factors are suspected of influencing the output. For instance it maybe desirable to understand the effect of binder and pigment on the adhesion of paints. Or one want to analyze the effect of temperature, pressure and alloying elements on a steel alloy. Or the one is evaluating the tire performance on the basis of various factors in the recipe. So precisely it is applicable for all the industries dealing with recipes for the product development. Through DOE, you can deal with even up to 6 or 8 factors of that particular recipe. It is a one time effort approach resulting in the production to be tim effective, free of vaining raw materials, efficient, as results compiled on the basis of equations/designed models. From the obtained results it can be analyzed that the motive which is to minimize the rolling resistance yet with better traction has been achieved throgh DOE based investigation, Thus an healthy eco-system can be established with lowest amounts of fuel consumption.

Keywords : DOE (Desing of Experiments), Carbon Reducing, Eco-Friendly

DESIGN & DEVELOPMENT OF CERAMICS FOR THERMOPOWER APPLICATIONS

Syeda Sabika Fatima¹, Faaz Ahmed Khan¹, Muhammad Ahmed Raza¹, Muhammad Usman¹

¹ Ned University Of Engineering And Technology Department Of Materials Engineering

Abstract

Strontium titanate(STO) ceramics were synthesized by solid state sintering using strontium carbonate and titanium dioxide. The samples were doped with bismuth oxide and iron oxide in different proportions. Compound to be formed as thermoelectric ceramic consist of SrBiTiFeO3. With the help of this project we learned that how thermoelectricmaterial ceramics can be of great importance other than their high temperature and corrosion resistance properties.

PHOTOCATALYTIC DEPOSITION OF HIERARCHICAL STRUCTURES

Salih Veziroglu^{1*}, Oral Cenk Aktas¹, Franz Faupel¹

¹ Chair for Multicomponent Materials, Institute of Materials Science, Kiel University, 24143 Kiel, Germany

Abstract

Noble metal (Au, Ag, and Pt, etc.) hierarchical structures have been received remarkable attention during the last decades, due to their special shape, high surface area, electronic, and catalytic properties. Especially, the incorporation of these hierarchical structures with wide-bandgap metal oxide semiconductors such as titanium oxide (TiO₂) and zinc oxide (ZnO) has been shown many times for various applications such as photocatalysis ^{1,2}. water splitting, self-cleaning³, biomolecular detection, sensor applications, and so on. There are various studies about the synthesis of hierarchical structures with well-defined size and morphology in the literature. However, it is still a challenge to achieve good adhesion between hierarchical structures and metal oxide surfaces, especially with TiO_2 thin film. Therefore, some approaches (seed-mediated growth, etc.) have been published to enhance the adhesion of metallic hierarchical structures on TiO₂ thin film by using some binder molecules (thiols and silanes, etc.). Mostly organic molecules are used for binding metallic hierarchical structures with a solid substrate. However, these may decrease the surface conductivity and contaminate the surface which affects the performance of the hierarchical structures. Similarly, electrodeposition methods can also be used to prepare metallic hierarchical structures on solid substrates. But the electrodeposition process is only applied on the conductive substrate such as indium tin oxide (ITO). Therefore, there is a need to prepare stable Au or Ag hierarchical structures on TiO_2 thin films without using any organic molecules (binders) or a conductive electrode. Here, we demonstrated a novel photocatalytic deposition approach for preparing Au and Ag hierarchical structures on TiO₂ thin film surface by UV illumination with strong chemical adhesion for wide-range applications such as photocatalytic degradation of organic contaminants, self-cleaning and oil-water separation. This method allows the controlling the geometry, size, and distribution of such Au and Ag hierarchical structures on TiO₂ thin film by simply changing the deposition solution, photocatalytic activity of metal oxide, UV illumination intensity, and time.

WO3 VE TEO2 İLAVESİNİN BAZALT CAMLARININ RADYASYON ZIRHLAMA ÖZELLİKLERİ ÜZERİNDEKİ ETKİLERİ

Bilgehan Güven^{1*}, Ediz Ercenk¹, Şenol Yılmaz¹

¹ Sakarya Üniversitesi, Mühendislik Fakültesi, Metalurji ve Malzeme Mühendisliği Bölümü, Sakarya, Türkiye.

Özet

Bu çalışmada doğal volkanik kayaç bazalttan elde edilen camın radyasyon zırhlama uygulamalarında kullanılabilirliği araştırılmıştır. Kırma öğütme sonrası toz hale getirilen bazalt kayacına ağırlıkça % 30 WO₃ ve TeO₂ katılarak elde edilen bileşimler homojenizasyon için bilyalı değirmende karıştırma işlemine tabi tutulmuştur. Katkısız, WO₃ ve TeO₂ katılı olarak hazırlanan 3 bileşim 1500 °C'de ergitilerek bazalt camları elde edilmiştir. Katkı maddelerinin bazalt camının radyasyon zırh kabiliyeti üzerine etkilerini incelemek amacıyla camların 276, 302, 356 ve 383 keV enerji değerlerinde lineer zayıflatma katsayıları, yarı-değer kalınlık ve ortalama serbest yol değerleri elde edilmiştir. Elde edilen değerler ele alındığında katkı maddelerinin bazalt camının radyasyon zırhlama özelliğini arttırdıkları tespit edilmiştir. Ayrıca WO₃ ilavesinin bazalt camının zırhlama kabiliyetini arttırmada TeO₂ ilavesinden daha iyi etki ettiği görülmüştür.

Anahtar Kelimeler: Bazalt, Cam, Radyasyon Zırhlama.

²Gebze Teknik Üniversitesi, Malzeme Bilimi ve Mühendisliği Bölümü, Gebze, Kocaeli, Türkiye

Özet

Silisyum nitrür seramikler sitotoksik olmaması, yüksek kırılma tokluğu, uzun ömürlü olması, aşınma direnci ve düşük sürünme katsayısı gibi üstün özellikleri nedeniyle biyo uygulamalarda gün geçtikçe daha fazla kullanım alanı bulmaktadır. Bu çalışmada, şerit döküm yöntemi ile biyomalzeme uygulamalarında kullanılmak üzere fonksiyonel derecelendirilmis Si₃N₄ malzemesinin, organik bazlı süspansiyonlarının hazırlanması ve hazırlanan şeritlerin farklı soğuk izostatik pres basıncında (1000-1500-2000-2500 bar) preslenmesi hedeflenmiştir. Kullanılan hammaddelere XRD, SEM, tane boyut analizi yapılıp hazırlanan süspansiyonun zeta potansiyeli ve reolojik ölçümleri yapılmış, optimum koşullarda döküm işlemi gerçekleştirilmiştir. Yapılan deneysel çalışmada ana hammadde olan Si_3N_4 'ün dısında solvent, bağlayıcı, plastiklestirici, sinterleme katkısı ve por yapıcı (grafit tozu) gibi ilaveler kullanılmıştır. Hazırlanan süspansiyonlar 18 saat karıştırılmış ve şerit döküm cihazı ile döküm yapılarak ham seritler elde edilmiştir. Ham seritler kurutulduktan sonra belirlenen boyutlarda kesilip 4 farklı porozite oranında (her katman 5 şerit olacak şekilde) lamine edilmiştir. Ardından üretilen silisyum nitrür şeritlerin şekillendirmesi için ise soğuk izostatik presleme (CIP) yöntemi kullanılmıştır. Şekillendirilen parçalara bağlayıcı giderme işlemi uygulanmış olup ardından hava ortamında 1500 °C'de sinterleme işlemi yapılmıştır. Sinterlenmiş olan poroz numunelerin taramalı elektron mikroskobu (SEM) ile yapılan mikroyapı analizlerinde şeritler arasındaki bağlanma, grafitin por oluşumuna etkisi, por yapısı ve dağılımı, sinterlenmenin gelişimi incelenmiştir. Sinter sonrası XRD analizi yapılarak fazlar incelenmiş olup sonuçların değerlendirmeleri yapılarak beklenen özellikleri sağlayan CIP basıncı seçilerek proses optimize edilmiştir.

Anahtar Kelimeler : Silisyum Nitrür, Fonksiyonel Derecelendirilmiş Malzeme, Şerit Döküm, Soğuk İzostatik Presleme.

KUBBE-İ HADRA RESTORASYON ÇİNİLERİNİN KARAKTERİZASYONU

Çetin Öztürk 1*

¹ Necmettin Erbakan Üniversitesi, Geleneksel Türk Sanatları Bölümü, Konya, Türkiye

Özet

Mevlana türbesinin (Kubbe-i Hadra) dış cephe duvarlarını yaklaşık 55 yıldır süsleyen yeşil çinilerde atmosferik etkiler nedeniyle zamanla tahribatlar meydana gelmiştir. Kültür bakanlığı ve Konya Müze Müdürlüğünce oluşturulan Bilim Kurulunun Kubbe-i Hadra' da gerçekleştirdiği incelemeler neticesinde kubbede restorasyonun gerekli olduğu anlaşılmıştır. Bilim kurulu tarafından 1835 yılına ait çini örnekleri baz alınarak yenilenecek olan çinilerin geleneksel tarzda, yüksek silis (en az %85 SiO₂) içerikli, yüksek mukavemetli ve dona dayanıklı ve de örtücü turkuaz renkte üretilmesi yönünde karar vermiştir. Bu çerçevede geleneksel tarzda çini üretimi yapan firmalardan belirlenen özelliklerde çini örnekleri talep edilmiş ve üretilen çiniler üzerinde standartlar dâhilinde yapılan kimyasal ve mineralojik analizler, kimyasallara ve dona dayanım testleri ile birlikte su emme, mukavemet ve termal şok testleri ile çiniler karakterize edilmiştir. Karakterizasyon çalışmaları sonucunda genel olarak yüksek silis içerikli (>%90) çinilerin daha düşük su emmeli ve oldukça yüksek mukavemetli olduğu ve ayrıca örtücü sırla iyi pekiştiği ve sırlı yüzeyde herhangi bir sır hatası içermediği anlaşılmıştır.

CHARACTERIZATION OF CREAM AND CREAM OILS' OBTAINED FROM COW MILK

Sabire Duman¹, Erman Duman²*

1 Afyonkarahisar Sağlık Bilimleri Üniversity, Health Sciences Faculty, Nutrition and Dietetic Department, Afyonkarahisar, Turkey

2 Afyon Kocatepe Üniversitesi, Engineering Faculty, Food Engineering Department, Afyonkarahisar, Turkey

Abstract

The aim of this study was to investigate the physico-chemical properties of cream and cream oil obtained from cow's milk, such as dry matter, non-fat dry matter, protein, acidity, pH, fatty acid composition, saponification number, unsaponifiable matter and sterol composition. ; As physical and chemical analysis, the amount of dry matter in cow cream was 61.72%, the amount of non-fat dry matter was 6.72%, pH values were 7.28, protein content was 4.45%, fat content was 55.0%, acidity was 1.05%. In cream oil, the free fatty acidity is 0.078% and the peroxide number is 0.55 meq-O_2 / kg, respectively. The total saturated fat content of the fatty acid content obtained from cow's milk was determined as 66.706%, and the total unsaturated fatty acid ratio was determined as 33.699%. When the fatty acid composition values of the oil obtained from cow cream were examined, it was determined that the highest value in terms of saturated fatty acids was palmitic acid and 35,547%, and when it was examined in terms of unsaponifiable matter and the sterol composition of the fat obtained from cow cream were determined. Studies have generally focused on cow and buffalo cream, and it will fill an important gap in the literature on the characterization of cream obtained from cow's milk as a result of our research.

INVESTIGATION OF CORROSION BEHAVIOR OF CONSTRUCTION STEELS IN HYDROCHLORIC ACID

Ibrahim GUNES 1

¹Giresun University, Department of Civil Engineering, Giresun, Turkey

Abstract

In this study, the corrosion behavior of construction steel in HCl solution with three different concentrations of 0.5M, 1M, 1.5M was investigated. Properties such as section losses and weight losses after the acidic effect have not been studied much. In order to fill this gap, the corrosion behavior of rebar exposed to acidic effects at different times was investigated. As a result of corrosion, it has been observed that the cross-sectional microstructures of the construction steel are corroded in the form of small cavities and pits/pitting from the outside to the inside. In addition, reduction in steel sections and decreases in yield and tensile stresses were observed.

FLY ASH BASED FOAM GEOPOLYMERS WITH IMPROVED DRYING SHRINKAGE PROPERTIES

Cansu Kurtuluş^{1*}, Mustafa Serhat Başpınar²

¹ Afyon Kocatepe University, Materials Science and Engineering Department, Afyonkarahisar, TURKEY

² Afyon Kocatepe University, Metallurgy and Materials Engineering Department, Afyonkarahisar, TURKEY

Abstract

Due to the high amount of emissions caused by the cement sector recently, there is a search for alternative raw materials instead of cement in buildings. In this context, geopolymer technology, which stands out, draws attention due to the recycling of wastes. However, the difficulties encountered during production prevent geopolymers from being put on the market. With this motivation, a total of 54 different recipes were studied using fly ash raw material in order to comprehensively examine the drying shrinkage of foam geopolymers. The molarity of the composition, the amount of fly ash it contains, the perlite additive, the calcium stearate additive, and the effect of curing temperature on drying shrinkage were investigated. Drying shrinkage data ranging from 4.053 to 1.272% were obtained. Drying shrinkage values varied inversely with the amount of fly ash, calcium stearate and perlite. The curing temperature and alkali concentration increased the shrinkage values. The obtained findings were also evaluated statistically, and it was determined that the factor affecting the drying shrinkage the most was the curing temperature.

THE IMPACT OF PARTICLE SIZE ON PHYSICAL AND MECHANICAL PROPERTIES IN WASTE-DERIVED GLASS FOAMS

Recep Kurtuluş^{1*}, Cansu Kurtuluş¹, Hakan Çiftçi², Taner Kavas¹

¹ Afyon Kocatepe University, Department of Materials Science and Engineering, Afyonkarahisar, Turkey

² Afyon Kocatepe University, Department of Mining Engineering, Afyonkarahisar, Turkey

Abstract

Glass foams (*GF*) possess great potential for waste valorization purposes. The foaming characteristics can be manipulated by variations in particle size (*PS*) distributions. In this study, we selected waste cathode-ray tubes (*CRTs*), glycerine (*G*), water glass (*WG*), and water (*W*) constituents with the roles of main waste, foaming agent, particle enveloping substance, and moisturizing content, respectively. Initially, the *GF* system was designed as follows: 90CRTs+2W+6WG+2W. After that, four different particle size ranges in waste *CRTs* were chosen as (- $500/+212 \mu$ m, *PS1*-coded), (- $212/+125 \mu$ m, *PS2*-coded), (- 125μ m, *PS3*-coded), and (- 75μ m, *PS4*-coded). The *GF* pellets were prepared by weighing, mixing, and pressing stages, accordingly. The prepared pellets were then heated via a conventional electric resistance furnace under the conditions of a 5°C. min⁻¹ heating rate up to 850°C, which were subsequently dwelled for 30 min at the peak temperature. The impact of *PS* on physical and mechanical properties was analyzed by measuring bulk density (ρ_{bulk}), estimating porosity (*EP*), and testing compressive strength (*CS*). According to the findings, the ρ_{bulk} values were equal to 599, 460, 303, and 264 kg. cm⁻³ for PS1 to PS4 samples in the respective order. Based upon the measured ρ_{bulk} , the *EP* values were found to be 78.3, 83.3, 89.1, and 90.4 percentages for PS1 to PS4 specimens, respectively. Lastly, the *CS* values revealed that decreasing *PS* caused the obtainment of diminishing resistance to mechanical failure. In conclusion, the authors deduced that waste CRTs glass can be valorized in an effective way with the aid of manipulating particle size.
